Methodology

The poll was conducted on Saturday **November 13th** on a representative sample of 1,292 people. The margin of error is plus or minus 2.8%. A group of 4,000 were selected to take part from a larger group of 35,000 on the basis of matching their demographics to the exit poll and census data on the basis of their age, gender, vote, educational attainment, and religious adherence from a panel of 35,000. The responses were then weighted to ensure they were exactly representative of the country in terms of age, gender, region, educational attainment, religious adherence and past voting behaviour.

This follows the latest research from Pew and the AAPOR. Dr Kevin Cunningham holds a degree in statistics from Oxford University and is a consultant to some of the leading polling companies in the world.
